mGuard

team2work's innovative mobile computing solution profits from the unique advantages of the mGuard platform

The basis of the integrated, all-in-one security solution...

... is the Linux-based mGuard device with XScale network processor by Intel (XP 42x), with up to 533 MHz, up to 64 Mbytes of SDRAM and 16 Mbytes of Flash. The processor features hardware-based DES, 3DES and AES encryption and two 10/100 Mbit Ethernet interfaces, which guarantee maximum data throughput for firewall (max. 99 Mbit/s) and VPN (max. 70 Mbit/s). Up to 250 VPN tunnels are possible. High-performance Kaspersky virus recognition is an optional feature.

The company team2work was recently founded in the German state of Baden-Wuerttemberg with an innovative business idea: developing a solution which allows employees to conveniently establish highly-secure connections from remote or mobile PCs to their own client back in the office – regardless of configuration or administration rights.

The successful start-up

team2work, founded in 2004, was so successful with its business idea, an innovative remote office connection, that it was awarded the "Innovation of the Month" award by the state of Baden-Wuerttemberg in February 2005. Just one month later, it received the "Innovation Prize 2005" from the "Initiative Mittelstand" ("Initiative of Medium-Sized Businesses") under the category mobile networks. In April, the managing director of team2work, Andreas Krög, became "Founder of the Month", a prize awarded by the Department of Trade and Industry from the state of Baden-Wuerttemberg.

The innovative idea ...

... was to develop a mobile client containing the full range of software necessary to establish a highly-secure SSH connection between Windows-based systems. The result is a special USB stick featuring self-sufficient software, requiring neither installation nor configuration to the guest system. For this reason, there are no administrative rights required for its use with a guest system.

The advantages to small and medium-sized businesses

"The user can connect from any Windows system to his or her computer in the company network and work within a familiar environment, using all the applications that are configured on the personal office PC or terminal server. This enables us to offer a flexible, easy-to-use and yet high secure and reliable solution, targeted at small and medium-sized businesses. Our solution is economical, eliminating the need for additional investment in expensive hard- and software," says the managing director of team2work, Andreas Krög.

Solution Partner from Innominate

The counterpart to the user's USB stick is the SSH gateway in the company network, for which the team2work developers had been looking for a starting point. They found the ideal development platform in the "device attached security" solution mGuard PCI from Innominate Security Technologies AG, which met all their requirements for necessary features, desired performance and economic efficiency.

Comprehensive support for Solution Partners

"We offer our Solution Partners extensive training and competent support, so that they can use our mGuard devices as high-capacity platforms towards their specific product development. In addition, Innominate offers a Software Development Kit designed to support our Solution Partners in the development of their own specific solutions. This not only significantly reduces development periods. Inevitably, costs are cut decisively, allowing the new product to be brought to market earlier," explains Olaf Siemens, CEO of Innominate.

Security, reliability and performance

The BlackBox products resulting from the collaboration between team2work and Innominate constitute the necessary secure gateways, ensuring the authentication of the remote user and the highly-secure RSA encryption of data. All BlackBox systems from team2work are equipped with a powerful Stateful Inspection Firewall and can be integrated either as a PCI card directly into the user's office PC or installed in a separate casing directly at the X-DSL modem or integrated behind an existing router.

Unassailable with the Innominate Stealth Mode

"One of the features of Innominate's platform that really caught our attention was its unique Innominate Stealth Mode. The technology works absolutely transparently and requires no IP address of its own, and therefore cannot be recognized by invaders – making it impervious to attack. With standard settings, our products can be installed quickly and simply. In order to customize the systems for special security requirements, they can also be configured individually using a web-based interface, which means that no errors can occur. Naturally, this is an important criterion for our target market," adds Kai Zirlewagen, also managing director at team2work.

Convincing technology for flexible development

"mGuard's top performance, sophisticated technology and flexible development possibilities convinced us that the system represented an optimal basis for our own developments. And we haven't been disappointed – we've been able to use mGuard technology to save enormous amounts of development time, as well as costs," Andreas Krög from team2work summarizes his experience.

Your advantages as an Innominate Solution Partner

- Taking advantage of significantly lower development times, you can utilize the convincing attributes of mGuard technology to offer a decisive added value.
- You can bring your security products to market earlier and more economically while offering outstanding USPs.
- You profit from the Innominate Software Development Kit (SDK) with cross-compiler, as well as native development tools and libraries.
- If desired, you will receive competent support straight from the developers of mGuard technology.

Take advantage of mGuard technology for the development of your security solution!
